Ig heavy chain V region - human (fragment)
C; Species: Homo sapiens (man)
C; Species: Homo sapiens (man)
C; Date: 22-Nov-1993 #sequence_revision 10-Nov-1995 #text_change 23-Jul-1999
C; Date: 22-Nov-1993 #sequence_revision 10-Nov-1995 #text_change 23-Jul-1999
C; Accession: $31666
R; Culsinier, A.M.; Gauthier, L.; Boubli, L.; Fougereau, M.; Tonnelle, C.
submitted to the EMBL Data Library, June 1992
A; Description: Mechanisms that generate human immunoglobulin diversity operate in A; Reference number: $31585
A; Reference number: $31585
A; Recession: $31666
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-138 <CUI>
A; Residues: 1-138 <CUI>
A; Cross-references: EMBL: 214202; NID: 930963; PIDN: CAA78571.1; PID: 930964
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin homology
F; 34-117/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B 5

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein search, using sw model

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                               Score

                                                            An antibody, with specific affinity for a characteristic epitope of the ED-B domain of fibronectin for the treatment of diseases characterized by vascular proliferation - \,
                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    this epitope was improved by introducing a number of mutations in the complementarity determining region (CDR) residues located at the periphery of the binding site. The improved antibody is used for rapid targeting markers of angiogenesis, for detecting diseases characterized by vascular proliferation, such as diabetic retinopathy, age-related macular degeneration or tumours. The antibody localizes the respective tissue within 3 to 4 hours after injection. It is used in immunoscintigraphic detection of angiogenesis and for diagnosis and therapy of tumours and diseases characterized by vascular proliferation. Coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis-related pathologies, especially caused by or associated
                                                                                                                                                      Neri D,
                                                                                                                                                                                                                                                                                                                                                             SGFV; single-chain variable antibody fragment; coagulant; ED-B domain; fibronectin; tunnor; cvascular proliferation; rheumatoid arthritis; angiogenesis; blood coagulation.
                                                                                                                                                                                                                                                                          30-AUG-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic peptide linker for constructing ScFv L19
                                                                                                                                                                                   (EIDG-)

                                                   The present sequence represents a modified human scFv antibody which has specific affinity for a characteristic epitope of the ED-B domain of fibronectin. The affinity of the antibody for this epitope was improved by introducing a number of mutations in the complementarity determining region (CDR) residues located at the periphery of the binding site. The improved antibody is used for rapid targeting marker of angiogenesis, for detecting diseases characterized by vascular and the complementarity determined by vascular and the complementarity det

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful in the detection and/or coagulation of blood vessels. An antibody with improved affinity to the ED-B domain is useful for diagnosis and therapy of tumours and diseases characterised by vascular proliferation, cancer, rheumatoid arthritis, neo-vasculature associated coular disorders and psoriasis. Treatment of angiogenesis related pathologies comprises the injection of conjugates comprising antibody and a molecule capable of inducing blood coagulation and blood vessel occlusion. The present sequence is a peptide linker used for constructing single-chain variable antibody fragment (scFV) L19 antibody related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (EIDG-) EIDGENOESSISCHE TECH HOCHSCHULE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               detection of angiogenesis and for diagnosis and therapy of tumours diseases characterized by vascular proliferation. The antibody can conjugated to a molecule which induces blood coagulation and blood vessel occlusion. These conjugates are used in the preparation of injectable compositions for the treatment of angiogenesis related injectable compositions for the treatment of anyter compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antiviral; antibacterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pathologies, especially caused by or associated with ocular anglogenesis.
The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human novel protein #96.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-OCT-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         raise antibodies/elicit an immune response, to determine your protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
        The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberran protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the
                                                                                                                                                                                                                                                         Tang

Polypeptides of the invention may also be useful, in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention.
The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea

     The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and cantibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as complements, and in antibody production. Complex markers, food supplements, and in antibody production. Complex markers, food supplements, and in antibody production. Complex markers, for identify compounds which bind to the complex markers. For polypeptides are used to identify compounds which bind to the complex markers, for sequencing, for chromosome or gene mapping, in the complex markers, for sequencing, for chromosome or gene mapping, in the compound of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to carget drugs to a tumour, in assays to determine duantitative components antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet attached the complex markers and to be completed to the invention may also be useful in treating platelet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ωy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   urchin and tomato. These were derived from expressed sequence to from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence protein of the invention.

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; novel protein; Antianaemic; osteopathic; antiinflammatory; immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerroprotective; antifungal; antiviral; antibacterial; antialiargic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or CR RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet contraceptive, tenden, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia, and contraceptive, transing osteoporosis and osteoarthritis, anaemia, contraceptive, parkinson's and Huntington's diseases, amylotrophic lateral for fungal infection or from autoimmunity, coancer, allergy, asthma, contraction or from autoimmunity, coancer, allergy, asthma, contraction diseases, nervous system disorders, and infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporesis and osteoarthritis, anaemia, alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or from anticiemnicity capacity and serbma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein expression or activity.

                                                                                                                                                                CC of interest invention describes a method for isolating a polynucleotide CC of interest that is present or is expressed in a genome of a first CC second mycobacterium strain and that is absent or altered in a genome of a CC using a bacterial artificial chromosome (BAC) vector. Recombinant BAC concerts, which are preferably immobilised, can be used to detect CC mycobacterial nucleic acids (genomic DNA, cDNA or mRNA) in bhological CC mycobacterial nucleic acids (genomic DNA, cDNA or mRNA) in bhological CC samples. The polynucleotides identified are useful as probes or primers CC polynucleotides contained in the recombinant BAC vectors it is possible to ophysically map a polynucleotide of mycobacterium of interest. By aligning the CC biological sample. The methods and vectors from the present invention possible to compare genomes between different strains or species and their non-pathogenic strains or species counterparts. ABG62422 to ABG6328 and ABB61227 to ABB61230 represent sequences used in the present invention can be compared the present invention contains of the present invention contains and ABB61227 to ABB61230 represent sequences used in the present invention can be compared the present invention can be compared to a bacterial counterparts. ABG62421 to ABG6328 and ABB61227 to ABB61230 represent sequences used in the present invention.

                                                         This sequence is the Raly (RNP associated with lethal yellow) protein, CC DNA encoding it can be used in a specific engineered fragment (SEF). CC The invention relates to gene targeting vectors that comprise 2 yeast comparise invention relates to gene targeting vectors that comprise 2 yeast cC selectable marker, a mammalian cell selectable marker and gene-specific CC prepared by a method, comprising: (a) preparing a shuttle vector CC marker, and a fragment of genomic DNA containing at least part of a gene CC marker cassette comprising a SEF comprising a marker capable of CC marker cassette comprising a second yeast selectable marker different CC expression in mammalian embryonic stem cells and the marker cassette CC planked on each side by mammalian gene-specific flanking sequences CC yeast cells with a shuttle vector as in (a) and with a SEF as in (b), and CC ellowing the shuttle vector and the SEF to recombination; (d) selecting the transformed yeast cells for expression targeting vector yeast cells selectable marker; and (e) isolating the SEF from the yeast cells selectable marker; and (e) isolating the SEF from the yeast cells selectable marker; and (e) isolating the condition of the gene to be targeting vector and the yeast cells selectable marker; and (e) isolating the targeting vector produced by recombination between the shuttle vector and the SEF to expression targeting vector produced by recombination between the shuttle vector and the selectable marker; and (e) isolating the constitute or inserting genes or regulatory sequences into preselected or genetic loci. The method can be used for identification of the function constructs or restriction sites which results in a significant saving of time and effort in preparing targeting constructs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В

                                                                                                                                            The invention relates to a novel haematopoietic protein (HP) comprising CC an amino acid (AA) sequence of formula: RI-LI-R2; R2-LI-R1, R1-R2; or CC an amino acid (AA) sequence of formula: R1-L1-R2; R2-LI-R1, R1-R2; Or CC (R1) a modified R2 are independently selected from: (I) a modified CC (II) a modified human interleukin-3 (hIL-3) AA sequence; (III) a modified human c-mpl ligand; and a colony stimulating factor (CSF); and L1 = a CC linker capable of linking R1 to R2. This sequence represents an example CC of a linker used to construct the proteins of the invention. CC vectors comprising the nucleic acid molecules are useful for the CC vectors comprising the nucleic acid molecules are useful in CC gene therapy. The HP's are useful for stimulating the production of CC dells and for treatment of haematopoietic disorders. Disorders that CC can be treated include leukopaenia, neutropeania, aplastic anaemia and thrombocytopaenia. In vitro uses include the ability to stimulate bone marrow and blood cell activation and growth before infusion into the

                                                                                                                         A new fusion protein is disclosed which has the formula R1-L-R2, CC R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or CC variant of human interleukin-3 (hIL-3), R2 is a second colony CC variant of human interleukin-3 (hIL-3), R2 is a second colony CC thaematopoletic growth factor or IL-3 variant, and L is a linker (of CC haematopoletic growth factor or IL-3 variant, and L is a linker (of CC are shown in AAR79298-R79335 and AAR79342-R79345. The fusion protein is CC are shown in AAR79298-R79335 and AAR79342-R79345. The fusion protein is CC adoptophinant DNA techniques. Specifically claimed examples of DNA CC sequences which encode these proteins are shown in AAQ97167-Q97204 and CC gall production. It is also useful as an IL-3 antagonist or as a CC cell production. It is also useful as an IL-3 antagonist or as a CC discrete antigenic fragment for production of antibodies useful in CC growth of certain cancer cells and in treatment of astima. The fusion cCC protein can also be used to stimulate bone marrow and blood cell contracterised by decreased levels of myeloid, erythroid, lymphoid cancer cells of the haematopoletic system. The protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects.
